Suite 140  
Andover, MA 01810

**DATE:** January 25, 2023      **RE:** 9302

**SUBJECT:** Response to Transportation Peer Review  
Proposed Medical Office Building  
15 Pleasant Valley Road  
Sutton, Massachusetts

---

Vanasse & Associates, Inc. (VAI) has prepared this memorandum to respond to comments issued by the Town of Sutton's transportation peer review consultant, Chappell Engineering Associates (CEA), as outlined in their December 7, 2022 peer review letter on the above referenced project.

To facilitate your review, this document follows the general outline of the CEA comment letter. As noted, based on the supplemental information provided, the findings of the initial Transportation Impact Assessment<sup>1</sup> (TIA) remain unchanged, with the proposed medical office building expected to have minimal impact to area traffic operations, with the proposed site access designed to provide the required sight distances to ensure safe access to and from the Project.

## TRAFFIC STUDY REVIEW

**Comment 1:** “The traffic study describes the proposed medical office building to be 5,150 square feet, yet the site plan shows a 5,253 square foot building. **The applicant should clarify the proposed building size.** As described later in this review, the slightly smaller building size assumed in the traffic study will not materially affect the conclusions of the traffic study.”

**Response:** The 5,253 sf building size identified on the site plan reflects the correct building size, which was modified subsequent to the preparation of the initial traffic assessment. VAI concurs with CEA that the minor discrepancy in building size would not affect the findings of the initial assessment, with no additional peak hour trips expected during the weekday morning peak hour, and only one additional peak hour trip during the weekday evening peak hour. However, the updated future Build condition traffic analyses reflect the additional evening peak hour trip.

**Comment 2:** “The traffic study focused on the following intersections:

---

<sup>1</sup> *Transportation Impact Assessment – Proposed Medical Office Building, 15 Pleasant Valley Road, Sutton, Massachusetts;* Vanasse & Associates, Inc., October 2022.

- Route 146 at Pleasant Valley Road
- Route 146 at Boston Road
- Pleasant Valley Road at Boston Road and Dudley Road

The traffic study area is appropriate for the proposed project and its expected traffic generation.

**Response:** Comment noted.

**Comment 3:** “The study provided a description of the area roadway network. Traffic volume and vehicle speed data were conducted in April and September 2022. Turning movement counts were conducted at the study intersections during the weekday AM peak period (7:00 to 9:00 AM) and the weekday PM peak period (4:00 to 6:00 PM). The counts showed that the weekday AM peak hour generally occurred from 7:00 to 8:00 AM and the weekday PM peak hour generally occurred from 4:30 to 5:30 PM. CEA concurs with the selected time periods used for analysis.

**A comparison of the actual count data to the volumes shown on the traffic flow networks shows that the left- and right-turn volumes on the Pleasant Street northbound approach to Boston Road appear to have been flipped during the weekday AM peak hour. This error was then carried through to the future No-Build and Build traffic flow networks as well as the capacity analyses. The traffic flow networks and the affected intersection capacity analyses should be updated to reflect the correct volumes.**

**Response:** VAI concurs with the CEA that the left- and right-turn volumes on the Pleasant Street northbound approach to Boston Road were transposed for the morning peak hour, with the left- and right-turn volumes interchanged. This error has been corrected, with updated capacity analysis results provided as an attachment to this document.

**Comment 4:** “The study did not make any adjustments to the collected data to represent pre-COVID traffic conditions. However, the new MassDOT *Traffic and Safety Engineering 25% Design Submission Guidelines* note that traffic volume data collected after March 1, 2022 are no longer subject to any adjustments to represent pre-pandemic traffic volume conditions, except in areas where land use is predominantly office. Therefore, since the traffic volume data were collected in April 2022 and land use in the area is predominantly industrial and commercial, COVID adjustments do not need to be applied to the data.

**Response:** VAI concurs that the unadjusted collected traffic counts are representative of typical traffic conditions and do not require seasonal adjustment.

**Comment 5:** “Seasonal adjustments were reviewed using MassDOT data. The data indicated that April counts were higher than annual average month conditions and no seasonal adjustments were therefore made to the collected counts. CEA concurs with these findings.”

**Response:** VAI concurs that traffic counts collected in April are typically higher than average annual conditions, and therefore represent a conservative analysis scenario.

**Comment 6:** “Accident data were reviewed and summarized within the traffic study. The data include the year 2020, which has not been authorized for use yet by MassDOT. However, the four

years prior provide sufficient information and exceed the three-year minimum required by MassDOT. The intersection of Route 146 and Boston Road is shown to have a crash rate well above the statewide average and is listed as a Highway Safety Improvement Program (HSIP) eligible location. A Road Safety Audit (RSA) was required of this intersection as part of the condition for approval of the Unified warehouse development on Boston Road. The intent of the RSA is to identify any measures to improve safety at the intersection. All other study intersections experienced crash rates below the statewide average.

**Response:** As noted by CEA, the majority of study area intersections exhibited average crash rates below the state average, with the Unified warehouse development committed to conducting an RSA for the intersection of Route 146 with Boston Road.

**Comment 7:** “A sight distance analysis was performed at the proposed driveway location based on observed 85th percentile speeds. This analysis shows that a minimum of 261 feet of clear sight distance is required to the south of the driveway to see traffic turning from Route 146 in time to avoid a collision. The applicant submitted a sight line plan and profiles showing that this distance can be achieved after removal of existing vegetation. **It is recommended that the existing grades within the sight triangle (identified on the sight line plan prepared by Vanasse & Associates) be maintained, or if altered through site construction work, assure that the sight lines shown in the profiles are not impacted. It is further recommended that the sight triangle area be kept clear of any obstructions such as landscaping, signs, or fences and be regularly maintained to assure adequate sight distance. The applicant should also ensure that existing vegetation within the Pleasant Valley Road right-of-way to the north of the driveway be trimmed or removed to assure adequate sight distance to the north.”**

**Response:** As noted by CEA, and consistent with the recommendations provided in the TIA, the proposed grading identified in the sight distance analysis provided in the TIA will be maintained, with regular clearing of vegetation to ensure sight lines are maintained. The applicant also commits to trimming or removing any existing vegetation to the north of the driveway that could impede sight lines in this direction.

**Comment 8:** “A 7-year design horizon was used for the No-Build and Build condition analyses consistent with MassDOT’s *Transportation Impact Assessment Guidelines*. An annual growth rate of 1.0 percent per year was used to project the future No-Build volumes consistent with other recent traffic studies in the area. CEA concurs with this growth rate.”

**Response:** Comment noted.

**Comment 9:** “The traffic study included the following planned developments within the town of Sutton:

- Unified warehouse—approximately 995,000 square foot warehouse distribution center on Boston Road.
- Blackstone Logistics Center (Sutton, Douglas and Uxbridge) – approximately 650,000 square feet of warehouse distribution space.

**Based on review of other studies in the area, there are additional developments that could impact traffic within the study area and should be included within the background growth assumptions including:**

- Lackey Dam Logistics Center, Sutton and Uxbridge – approximately 180,000 square feet of warehouse distribution space with access on Oakhurst Road and Lackey Dam Road.
- 85 Gilmore Drive, Sutton – approximately 140,000 square feet of industrial manufacturing space and 40,000 square feet of ancillary office space.
- Campanelli Business Park Phase 1, Uxbridge – 800,000 square feet of industrial space on Campanelli Drive.
- Campanelli Business Park Amazon Facility, Uxbridge – an Amazon sortation facility at 515 Douglas Street.
- Gilboa Street, Douglas – 1.1 million square feet of warehouse space on Gilboa Street.

**The applicant should contact the towns of Sutton, Uxbridge, and Douglas to determine the status of these and other potential development projects and update the future volume conditions as appropriate.**

**Response:** As requested by CEA, the future year traffic volume projections were updated to reflect traffic associated with the five identified development projects in Sutton, Uxbridge, and Douglas. Specifically, project-related traffic increases associated these Projects were incorporated into the analysis of future No-Build and Build conditions. Background traffic growth calculations have been provided as an attachment to this document.

**Comment 10:** “The trip generation of the development was estimated using the Institute of Transportation Engineers (ITE) *Trip Generation Manual 1* for Land Use Code 720 (Medical-Dental Office Building). While the land use code is correct, the trip generation was based on a slightly smaller building size than shown on the site plan. This difference, however, would only increase trip generation by one vehicle during the weekday AM peak hour and would therefore not alter the conclusions of the traffic study. During the weekday PM peak hour, the report for some reason already assumed a higher number (25 trips) than the correct building size would generate (18 trips). Therefore, the trip generation assumptions are acceptable.

**Response:** The trip generation projections for the Project were revised to reflect the current building square footage, including the weekday evening peak hour. Based on the current plan the Project is expected to generate 16 new vehicle trips (13 entering and 3 exiting) during the weekday morning peak hour and 21 new vehicle trips (6 entering and 15 exiting) during the weekday evening peak hour. Revised capacity analyses included with this response letter reflect the correct peak hour trip generation for the Project.

**Comment 11:** “The traffic study describes that the trip distribution methodology was based on existing travel patterns with approximately 35 percent to/from each the north and south on Route 140, 20 percent to/from the east on Boston Road, and 10 percent to/from the west on Boston Road. The distribution assumptions appear appropriate for the proposed use.”

**Response:** Comment noted.

**Comment 12:** “Capacity analyses were performed at the study area intersections under Existing, No-Build and Build conditions. **As described in Comments 3 and 9 above, the analyses should be updated to reflect the correct turning movements and background development projects. The analysis table for the signalized intersection should also be**

**expanded to show the results for each movement (rather than by approach) and should show 95th percentile queue calculations.** While the Route 146 and Boston Road intersection shows slightly better results than the recent traffic study prepared by VHB for the Unified warehouse development, the difference lies in the fact that VAI adjusted the lost time (the total of start-up delay plus all of the yellow and red clearance times) down by 2 seconds on each approach. This is reasonable given the very long yellow and all-red intervals and results in more realistic representation of intersection operations. The results of the analyses indicate that the medical office building will not have a significant effect on intersection operations. This should be verified once the capacity analyses have been updated as requested.

**Response:** As requested, revised capacity analysis results have been provided as an attachment to this document that summarize the v/c ratio, movement delay, level of service and average/maximum queues for all intersection movements. As indicated, the Project is expected to result in no notable impact to traffic operations, with overall delays increasing by approximately one second or less per vehicle at the intersection of Route 146 with Boston Road, with minimal impact to vehicular queuing at all study area locations.

## **CONCLUSION**

As documented in this response, the findings of the initial TIA remain unchanged, with the proposed medical office building expected to have minimal impact to area traffic operations, with the proposed site access designed to provide the required sight distances to ensure safe access to and from the Project.

#### Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.  
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.  
Queue shown is maximum after two cycles.

#### Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.  
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.  
Queue shown is maximum after two cycles.

#### Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.  
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.  
Queue shown is maximum after two cycles.

#### Intersection Summary

Area Type: Other

Cycle Length: 176

Actuated Cycle Length: 164

Natural Cycle: 90

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 0.81

Intersection Signal Delay: 36.5

Intersection LOS: D

Intersection Capacity Utilization 79.8%

ICU Level of Service D

Analysis Period (min) 15

Splits and Phases: 13: Boston Road & Route 146

Lane Group	SBR
Permitted Phases	6

#### Intersection Summary

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.
