Re: Proposed Warehouse and Distribution Facilities
Traffic Impact Evaluation for Buildings 2 and 3
105 Providence Road, Sutton, Massachusetts

VHB has prepared this Traffic Impact Evaluation (hereinafter referred to as "the Study") to summarize the anticipated traffic impacts associated with two proposed warehousing and distribution buildings (the Project) to be located at 105 Providence Road (the Site). These buildings are referred to as Buildings 2 and 3 in the Project filings. In total, the two buildings will support approximately 995,000 square feet (sf) of warehouse and distribution space. The two buildings will not house e-commerce last-mile home delivery operations.

A third building (referred to as Building 1) that is part of the overall development plan for the Site is currently in the planning stages, and is not part of the current filing or traffic analysis. A separate detailed traffic impact and access study will be prepared as part of a future filing for Building 1 that will include a cumulative impact analysis of all three proposed buildings.

Access to the Site will be provided by a proposed subdivision road, referred to in as Unified Parkway, that will connect Boston Road in the south with Providence Road (Route 122A) in the north, as documented in the Town of Sutton's Planning Board Certificate of Approval of a Definitive Subdivision Plan dated January 12, 2022. Unified Parkway will intersect Boston Road approximately 800 feet to the east of the Galaxy Pass traffic signal. The Site location in relation to the surrounding roadways is shown on Figure 1.

As documented in this Study, the Project is not expected to have significant impacts on the surrounding roadway network and will not trigger traffic improvements on roadways and at intersections under the control of by the Massachusetts Department of Transportation (MassDOT). Nonetheless, the Study has been prepared in conformance to both MassDOT along with the Town of Sutton requirements.

In total, the Project is expected to generate approximately 1,406 trips over the course of an average weekday, 130 trips (102 entering and 28 exiting) during the Project's operational weekday morning peak hour and 171 trips (58 entering and 113 exiting) during the Project's operational weekday evening peak hour. The estimated peak hour site generated traffic will result in relatively minor increases to the traffic volumes at the study area intersections.

Additionally, it is expected that the Project's peak hours of operations will not coincide with the peak hours of the adjacent roadway network, further minimizing the impacts to the most critical time periods for traffic volumes.

Notwithstanding this finding, the geometry of the proposed intersection of Boston Road/Unified Parkway has been designed to support the future full build-out of the Site even though the application only covers Buildings 2 and 3 at this time. Further review of the cumulative traffic impacts and traffic mitigation needs will be discussed in the future traffic impact and access study that will be prepared as part of the future filing for Building 1.

Overall, this Study finds that Buildings 2 and 3 will have a minimal effect on traffic flow and operations in the area, and the development can be supported by the area roadway system without the need for capacity improvements or other mitigation measures.

Existing Conditions

A study area for the Project was developed based on the traffic characteristics of the proposed uses and an understanding of the surrounding transportation network that will serve the Project site.

Existing conditions for the Study were developed by conducting field reconnaissance and obtaining traffic volumes at the study locations listed below.

- Providence Turnpike (Route 146) at Boston Road
- Boston Road at Dudley Road/Pleasant Valley Road
- Boston Road at Galaxy Pass
- Providence Road (Route 122A) at Boston Road
- Boston Road at Site Driveway (Build conditions only)

Intersection Geometry

The existing traffic control and lane usage for the study area intersections is presented on Figure 2. The following sections describe each of the study area intersections.

Route 146 at Boston Road

Boston Road intersects Route 146 from the east and west to form a four-legged signalized intersection under MassDOT jurisdiction. The Boston Road eastbound approach consists of an exclusive left-turn lane, a through lane, and an exclusive channelized right-turn lane under yield-sign control. The Boston Road westbound approach consists of two exclusive left-turn lanes, a through lane, and an exclusive right-turn lane. The Route 146 southbound approach consists of two exclusive left-turn lanes, three through lanes, and an exclusive right-turn lane. The Route 146 northbound approach consists of two through lanes and a shared through/right-turn lane. Left-turns along the Route 146 northbound approach are accommodated by Pleasant Valley Road, immediately south of the intersection, that serves as a jug handle-type movement. The directions of travel along Boston Road are separated by a double-yellow centerline and the directions of travel along Route 146 are separated by a raised median. Pedestrian and bicycle facilities are not provided at the intersection. Land uses at the intersection primarily consist of commercial properties.

Boston Road at Dudley Road/Pleasant Valley Road

Dudley Road and Pleasant Valley Road intersect Boston Road from the north and south, respectively, to form this four-legged unsignalized intersection under Town of Sutton jurisdiction. The Boston Road eastbound and westbound approaches both consist of a shared left-turn/through lane and a through/right-turn lane. The Boston Road approaches are freely operating movements. The Dudley Road southbound and Pleasant Valley northbound approaches both consist of a single travel lane under stop-sign control. The Pleasant Valley Road northbound approach also serves vehicles traveling along Route 146 northbound destined to Boston Road westbound due to the lack of left-turn lanes along the northbound approach at the intersection of Route 146 at Boston Road. Directions of travel along all approaches are separated by a double-yellow centerline. Pedestrian and bicycle facilities are not provided at the intersection. Land uses at the intersection consist of residential uses, wooded areas, and undeveloped land.

Boston Road at Galaxy Pass

Galaxy Pass intersects Boston Road from the south to form this three-legged signalized intersection under Town of Sutton jurisdiction. The Galaxy Pass northbound approach consists of an exclusive left-turn lane and a shared left-turn/right-turn lane. Galaxy Pass serves as the primary driveway to a commercial and retail plaza containing a Market 32 supermarket, several restaurants, and various other commercial businesses. The Boston Road eastbound approach consists of a through lane and a shared through/right-turn lane. The Boston Road westbound approach consists of a shared left-turn/through lane and a through lane. Directions of travel along all approaches are separated by a double-yellow centerline. Pedestrian and bicycle facilities are not provided at the intersection. Land uses at the intersection consist of the shopping plaza served by Galaxy Pass, wooded areas, and undeveloped land.

Providence Road at Boston Road

Boston Road intersects Providence Road from the south to form a three-legged unsignalized intersection under Town of Sutton jurisdiction. Two private driveways are also located along the north side of Boston Road, opposite Boston Road at the intersection. All three approaches to the intersection consist of a single lane. The Boston Road northbound approach operates under stop-sign control and the Providence Road approaches operate as free movements. Directions of travel along all approaches are separated by a double-yellow centerline. A sidewalk is provided along the east side of Boston Road and the south side of Providence Road, east of the intersection. A marked crosswalk is also provided approximately 125 feet east of the intersection. Land uses at the intersection consist of residential and commercial properties.

Traffic Volumes

Traffic volume data was collected at the study area intersections and along Boston Road to determine the existing travel patterns throughout the study area. Manual turning movement counts (TMCs) were conducted at the four study area intersections in October 2021 from 6:00 AM to 7:00 PM.

Traffic Volume Adjustment Factors

COVID-19 Pandemic Adjustments

In accordance with MassDOT guidelines, traffic counts collected after March 13, 2020 may not be representative of typical traffic volumes due to the coronavirus disease 2019 (COVID-19) pandemic.^{1, 2} To account for the impact of the COVID-19 pandemic on traffic volumes, the MassDOT Transportation Data Management System (TDMS) was used to conduct a review of historical traffic count data from nearby count stations along Route 146 and Boston Road to determine if any adjustments to the 2021 data were necessary. Based on this review, traffic count data dating back to 2014 was used to develop the appropriate adjustment factors to apply to the 2021 traffic data. The 2021 weekday morning peak hour counts were lower than the historical traffic data obtained from the TDMS and a factor of 1.11 was applied to the 2021 counts. The 2021 weekday evening peak hour counts were higher than the historical traffic data obtained from the TDMS and a factor of 0.77 would be applied to the 2021 counts to adjust to pre-pandemic conditions. To provide a true existing conditions evaluation for the weekday evening peak hour, this evaluation did

¹ Chief Engineer Patricia Leavenworth. MassDOT Engineering Directive E-20-005 – Guidance on Traffic Count Data. 11 May 2020.

² Massachusetts Department of Transportation, Highway Division. Guidance on Traffic Count Data. Apr 2020.

not adjust the weekday evening traffic volumes downward to reflect pre-pandemic conditions. The detailed COVID-19 pandemic adjustment calculations are provided in the Appendix.

Seasonal Variation Adjustments

Traffic on a given roadway typically fluctuates throughout the year depending on the area and the type of roadway. Based on MassDOT guidelines for the preparation of a traffic study, existing traffic volumes must represent annual average-month conditions. Based on MassDOT 2019 Weekday Seasonal Adjustment Factors, June and October traffic volumes along Urban Principal Arterials³ are approximately 7 to 9 percent higher than average annual conditions. June and October traffic volumes along Urban Minor Arterials⁴ are approximately 6 to 14 percent higher than average annual conditions. Therefore, the June and October 2021 traffic counts were used without a seasonal adjustment. The MassDOT seasonal adjustment factors are provided in the Appendix.

Existing Traffic Volumes

Figure 3 depicts the existing condition weekday morning and weekday evening peak hour traffic volumes at the study area intersections.

Crash Analysis

Crash data for the study area intersections were obtained from MassDOT for the most recent five-year period for which complete data is available (between 2015 and 2019).

In addition to the collision summary, incident occurrence was compared to the volume of traffic through a particular intersection to determine significance and if there are existing safety issues. Accordingly, the crash rates were calculated for each study area intersection and compared with the statewide and district-wide (MassDOT District 3) averages. For signalized intersections, the statewide average is 0.78 collisions per million entering vehicles (c/mev) and the district-wide average is 0.89 c/mev. For unsignalized intersections, the statewide average is 0.57 c/mev and the district-wide average is 0.61 c/mev. The crash rate worksheets are provided in the Appendix. A summary of the MassDOT crash data at the study area intersections is provided in Table 1.

³ Route 146 in Sutton in the vicinity of the site is classified as an Urban Other Principal Arterial (U3) that is under MassDOT jurisdiction.

⁴ Boston Road in Sutton in the vicinity of the site is classified as an Urban Minor Arterial (U4) that is under Town of Sutton jurisdiction.

^b Weekday between 4:00-6:00 PM

Based on the MassDOT IMPACT website, the study area intersections experienced a total of 127 motor vehicle collisions between 2015 – 2019, the five years of complete data that is available from MassDOT.

A total of 108 crashes occurred at the intersection of Route 146 at Boston Road. This intersection experienced a crash rate of 1.03 c/mev, which is above the District 3 average for signalized intersections. This intersection was also identified as a Top 200 Crash Cluster for the years 2017 – 2019 by MassDOT as part of their Highway Safety Improvement Program (HSIP), indicating that the intersection has a crash rate in the top 5 percent of the area served by the Central Massachusetts Regional Planning Commission (CMRPC). The most prevalent crash type at this intersection were rear-end collisions, which may be a result of high levels of congestion, queuing, and unexpected stops at the traffic signal.

The remaining three study area intersections experienced crash rates well below the District 3 average for signalized and unsignalized intersections. The intersection of Boston Road at Dudley Road/Pleasant Valley Road experienced a total of 9 crashes during the review period, with the majority being angle-type collisions. The intersection of Boston Road at Galaxy Pass experienced a total of 8 collisions during the review period, with the majority being angle and sideswipe collisions. The intersection of Providence Road at Boston Road experienced a total of 2 collisions during the review period. Based on a review of the crash data, no apparent trends or patterns were identified at the study area intersections.

Future Conditions

To estimate the impact of the proposed development's traffic on the adjacent roadway system, existing traffic volumes were projected to the year 2029. This design horizon represents a seven-year projection from the year of this traffic study that is in accordance with MassDOT guidelines for transportation impact assessments. Traffic volumes at that time would include existing traffic, new traffic due to normal traffic growth, and traffic related to significant development by others that are expected to be completed within the design horizons. The incremental impacts of the proposed development may then be determined by adding site-generated traffic volumes (Build conditions) and making comparisons to the baseline (No-Build) conditions.

No-Build Conditions

Traffic growth is a function of the expected land development in a region. To predict a rate at which traffic can be expected to grow during the forecast periods, both historical growth and planned areas developments were examined.

Historical Growth

To develop future baseline traffic volume conditions, two components of traffic growth were considered. First, an annual average traffic-growth percentage was determined based on a review of recent traffic studies that were submitted for nearby projects. A recent traffic study⁵ prepared for another project in the town that went through MassDOT review was reviewed and it was determined that a one percent annual traffic growth rate for future traffic

⁵ *Traffic Impact and Access Study – Blackstone Logistics Center, Sutton, Douglas, and Uxbridge, Massachusetts; VHB; January 11, 2021.*

projections is appropriate. Accordingly, the one percent annual traffic growth rate was applied to the existing conditions traffic volumes.

Background Developments

Traffic to be generated by planned developments anticipated to add substantial traffic volumes through the study area were considered in projecting future traffic volumes. Specifically, traffic volumes from the following development were included within the future traffic-volumes as part of this Study.

- Blackstone Logistics Center – 40 and 100 Lackey Dam Road: A 640,000 sf warehouse is proposed at 40 and 100 Lackey Dam Road in the Town of Uxbridge, adjacent to the Town of Sutton. Project generated traffic for this project was obtained from the traffic study and added to the future conditions traffic volumes networks.

In addition to this project, traffic volumes from a few planned relatively smaller residential developments at 19 Canal Street and 15-17 Rice Road in Millbury and some additional development potential at the Pleasant Valley Crossing Phase III project off Galaxy Pass in Sutton were assumed to be accounted for in the one percent annual traffic growth rate.

No-Build Traffic Volumes

The 2029 No-Build peak hour traffic volumes were accordingly developed by applying a one percent compounded annual traffic growth rate to the 2022 Existing volumes and adding estimated traffic associated with the background developments. The 2029 No-Build traffic volumes are shown graphically for the study area intersections on Figure 4 for the weekday morning and weekday evening peak hours.

Build Conditions

The Project will consist of the construction of two buildings (referred to as Buildings 2 and 3) that will support warehouse and distribution uses, encompassing a total of approximately 995,000 sf⁶ of space. As discussed earlier, access to the Site will be provided by Unified Parkway, a newly approved subdivision roadway that connects Providence Road (Route 122A) in the north to Boston Road in the south. Unified Parkway will intersect Boston Road from the north, at a location approximately 800 feet east of the Galaxy Pass signalized intersection.

Trip Generation

For trip generation estimates, two sources of information were considered. The Proponent identified two exiting sites in Massachusetts (one in Sutton and the other in Lancaster) that have operations similar to those anticipated for Buildings 2 and 3, albeit with building sizes smaller than the proposed buildings on the Site. Additionally, trip rates published in the Institute of Transportation Engineers (ITE) Trip Generation Manual⁷ were reviewed. Based on a review of available information, it was determined that ITE Land Use Code (LUC) 154 – High Cube Warehouse and Short-Term Storage Warehouse is an appropriate land use to estimate Project-generated trips.

The trip-generation summary based is summarized in Table 2 and the corresponding calculations are provided in the Appendix. Based on the ITE trip generation guidelines for LUC 154, the Project is expected to generate 1,406 trips over

⁶ Trip generation estimates in this study have been prepared for a slightly larger development size of 1,005,000 sf

⁷ Institute of Transportation Engineers. Trip Generation Manual, 10th ed. Washington, DC, 2017.

the course of an average weekday, with 130 trips (102 entering and 28 exiting) during its weekday morning peak hour of operations and 171 trips (58 entering and 113 exiting) during its weekday evening peak hour of operations. To provide a conservatively worse case analysis, it was assumed that the peak of traffic operations for the two buildings occurs at the same time as the peak of the roadway traffic. A review of the data for the two empirical sites indicated that the peak hour trip rates for sites were lower than the numbers presented in Table 2.

Table 2 Trip Generation Summary

Time Period/Direction	Estimated Trips ^a
Weekday Daily	1,406
Weekday Morning Peak Hour	
Enter	102
Exit	28
<i>Total</i>	130
Weekday Evening Peak Hour	
Enter	58
Exit	113
<i>Total</i>	171

a Based on ITE LUC 154 (High-Cube Transload and Short-Term Storage Warehouse)

Trip Distribution

The directional distribution of the vehicular traffic approaching and departing the Site is a function of the land use, population densities, the location of employment, existing travel patterns, and the efficiency of the existing roadway system. The trip distribution for the Project was developed based on the most recent U.S. Census Journey-to-Work data for employees working in Sutton. The trip distribution patterns are shown in Table 3 and Figure 5.

Table 3 Trip Distribution Summary

Direction (to/from)	Routes Used	Percentage of Trips
North	Route 146	32%
South	Route 146	31%
West	Boston Road	7%
South/East	Providence Road	18%
North/West	Providence Road	12%

The trip distribution patterns shown in Table 3 were applied to the Project-generated trips to develop the trip assignments by turning movement. The Project-generated traffic volume networks are shown in Figure 6 for the weekday morning and evening peak hours.

Build Traffic Volumes

The Project-generated traffic volumes were added to the No-Build traffic volumes to develop the Build peak-hour traffic-volume networks. The 2029 Build weekday morning and evening peak-hour traffic volumes are presented in Figure 7.

Site Access

As noted earlier, access to the Site is proposed via the intersections at either end of the proposed subdivision roadway referred to as Unified Parkway. It is expected that a higher proportion of the Site traffic will use the intersection of Unified Parkway/Boston Road, which is located approximately 800 feet to the east of Galaxy Pass. While the current Project only seeks review and approval for Buildings 2 and 3, the Applicant plan to size the proposed intersection of Unified Parkway/Boston Road to support traffic that would be generated by the full build-out of the Site. Analysis indicates that expected traffic volumes from Buildings 2 and 3 would not exceed the Warrants for the installation of a traffic signal at the intersection. The intersection is therefore depicted as an unsignalized, stop controlled intersection in the Project submittal. Final traffic control and configuration of the intersection will be further refined as part of a future traffic study after the details of Building 1 are further developed.

Traffic Operations Analysis

Capacity Analysis Methodology

Capacity analyses were performed for the study area intersections with the 2022 Existing, 2029 No-Build, and 2029 Build traffic volumes during the weekday morning and evening peak hours based on the concepts and procedures in the Highway Capacity Manual (HCM)⁸ using the *Trafficware Synchro Software* computer program. This software program is a MassDOT approved traffic analysis tools for determining intersection capacity operations.

The analysis results are categorized in terms of Level of Service (LOS), which describes the qualitative intersection operational conditions based on the calculated average delay per vehicle. The relationship between LOS and delay is summarized in Table 5.

⁸ Transportation Research Board. Highway Capacity Manual. 2000.

Table 5 **Level of Service Criteria**

Level of Service	Unsignalized Intersection Criteria Average Total Delay (Seconds per Vehicle)	Signalized Intersection Criteria Average Total Delay (Seconds per Vehicle)
<i>A</i>	< 10.0	< 10.0
<i>B</i>	10.1 to 15.0	10.1 to 20.0
<i>C</i>	15.1 to 25.0	20.1 to 35.0
<i>D</i>	25.1 to 35.0	35.1 to 55.0
<i>E</i>	35.1 to 50.0	55.1 to 80.0
<i>F</i>	> 50.0	> 80.0

Source: Highway Capacity Manual 2000.

Queue Length Methodology

The study area intersections were also evaluated with respect to vehicle queuing. For signalized intersections, the quantitative measures of vehicle queue length are defined as the 50th and the 95th percentile queues. The 50th percentile queue represents the average queue length and the 95th percentile queue represents the calculated maximum back of queue that has a probability of 5 percent or less of being exceeded during the peak hour.

For unsignalized intersections, the quantitative measure of vehicle queue length is defined as the 95th percentile queue. The 95th percentile queue represents the percent of time during the peak period being analyzed that the calculated maximum back of queue would be equal to or less than the percentile estimate (i.e., the maximum queue length that would be exceeded only 5 percent of the time).

Intersection Operational Results

The capacity and queue length analysis results are summarized in Table 6 for the 2022 Existing, 2029 No-Build, and 2029 Build traffic-volume conditions. The analysis shows that Buildings 2 and 3, in and of themselves, would not trigger the need for any substantive improvements on the area roadway system. The computer-generated analysis reports are provided in the Appendix.

Queue lengths in feet.

Route 146 at Boston Road

Based on the operations analysis, the intersection of Route 146 at Boston Road currently operates at an overall LOS D during both the weekday morning and evening peak hours. Under the 2029 No-Build and Build conditions, the intersection is expected to operate at an overall LOS E during the weekday morning peak hour and will continue to operate at LOS D during the weekday evening peak hour. Capacity constraints⁹ are currently experienced along most approaches and movements at the intersection. The existing traffic signal timing at the intersection results in a cycle length of approximately 180 seconds, or approximately three minutes, when each phase of the cycle reaches the maximum amount of allotted green time. Long cycle lengths are typically used at intersections with high volumes and multiple turning and through lanes along some or all approaches. A result of longer cycle lengths such as the one at this intersection is high delays due to the amount of red time each phase experiences. However, a long cycle length is necessary to efficiently process the level of traffic at this intersection. The longest queues at the intersection occur along the Route 146 northbound approach under all scenarios and during both time periods.

Based on the results of the operations analysis, the Project is not expected to have a significant impact on traffic operations.

Boston Road at Galaxy Pass

The intersection of Boston Road at Galaxy Pass currently operates at an overall LOS A and is expected to continue to operate at LOS A under the future conditions with or without the Project. The Project is expected to have minimal impact on traffic operations at this intersection. The traffic volumes at the intersection are well below the operational capacity under all conditions during both the weekday morning and evening peak hours. Queues at the intersection

⁹ Volume-to-capacity (v/c) ratios >1.00, long vehicle delays (LOS F), and/or long vehicle queues.

are not expected to exceed 75 feet (three passenger vehicles) during both peak periods under all scenarios. Mitigation measures are not necessary at this intersection to accommodate the Project.

Boston Road at Dudley Road/Pleasant Valley Road

The critical movements at the unsignalized intersection of Boston Road at Dudley Road and Pleasant Valley Road currently operate at LOS C or better. The Project is not expected to have a significant impact on traffic operations at this intersection. The Pleasant Valley Road northbound and Dudley Road southbound approaches are expected to have increases in delays of 4 and 5 seconds, respectively, with the addition of Project-related traffic and will continue to operate well below their capacity during both peak hours under the 2029 Build conditions scenarios. Mitigation measures are not necessary at this intersection to accommodate the Project.

Providence Road at Boston Road

The critical movements at the unsignalized intersection of Providence Road at Boston Road currently operate at LOS C or better. The Project is not expected to have a significant impact on traffic operations at the intersection. The Boston Road northbound approach may experience an increase of 7 seconds of delay during the weekday evening peak hour due to exiting traffic from the Project site. This approach is expected to continue to operate well below its capacity and may experience maximum queues of up to 135 feet (between 5 and 6 vehicles, on average) during the weekday evening peak hour. Mitigation measures are not necessary at this intersection to accommodate the Project.

Boston Road at Unified Parkway

The critical movements at the proposed intersection of Boston Road at the Site Driveway are expected to operate at LOS C during the weekday morning and evening peak hours. Based on the operations analysis, single lane approaches along Boston Road and the site driveway are sufficient to accommodate the overall levels of traffic and turning movements at this intersection as part of the development of Buildings 2 and 3. Additional changes may be studied for this location as part of the future filing for Building 1.

Summary of Findings

Existing and future conditions in the study area have been described, analyzed, and evaluated with respect to traffic operations and the impact of the proposed Project. Based on the findings of this traffic study, the Project is expected to generate approximately 1,406 trips over the course of an average weekday, 130 trips (102 entering and 28 exiting) during the weekday morning peak hour and 171 trips (58 entering and 113 exiting) during the weekday evening peak hour, resulting in only minor increases to the traffic volumes at the study area intersections.

The traffic operations analysis indicates that there may be minor traffic volume increases and related minor increases in delay and that the existing transportation infrastructure can accommodate these small increases in traffic volumes and delay.

The analysis contained within this traffic study concludes that the Project, comprised of Buildings 2 and 3, can operate without the need for any traffic mitigation or capacity improvements at the study area locations. Improvements to the proposed intersection of Boston Road/Unified Parkway are aimed at addressing the full build-out geometry needs for the intersection. Further review of the cumulative traffic impacts and off-site traffic mitigation needs will be discussed in the future traffic impact and access study that will be prepared as part of the future filing for Building 1.

Intersection Summary

Area Type: Other

Cycle Length: 176

Actuated Cycle Length: 162.5

Natural Cycle: 130

Control Type: Actuated-Uncoordinated

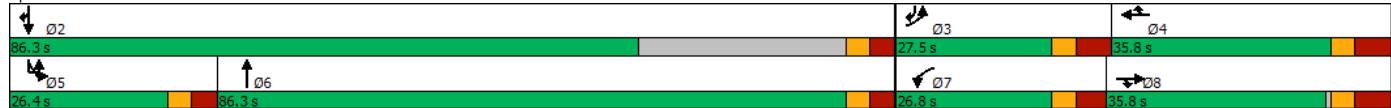

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 4: Route 146 & Boston Road

Intersection Summary

Area Type: Other

Cycle Length: 176

Actuated Cycle Length: 160.9

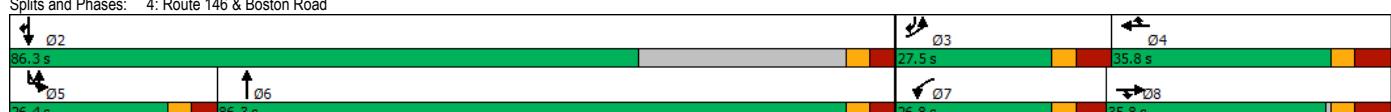

Natural Cycle: 90

Control Type: Actuated-Uncoordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 4: Route 146 & Boston Road

Intersection Summary

Area Type: Other

Cycle Length: 176

Actuated Cycle Length: 160.1

Natural Cycle: 130

Control Type: Actuated-Uncoordinated

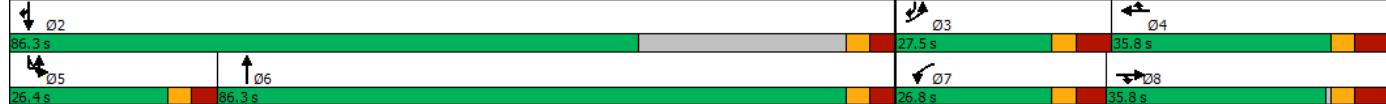

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 4: Route 146 & Boston Road

Intersection Summary

Area Type: Other

Cycle Length: 176

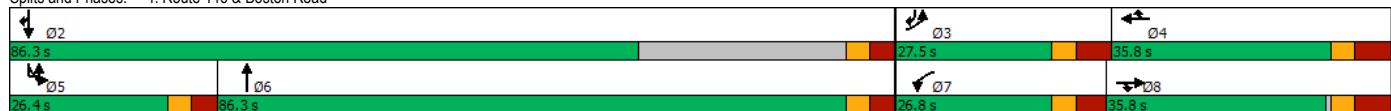

Actuated Cycle Length: 165.3

Natural Cycle: 110

Control Type: Actuated-Uncoordinated

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Splits and Phases: 4: Route 146 & Boston Road

Intersection Summary

Area Type: Other

Cycle Length: 176

Actuated Cycle Length: 166.9

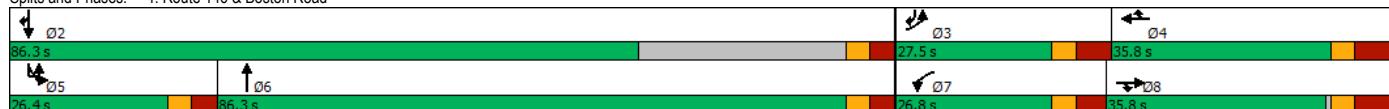

Natural Cycle: 110

Control Type: Actuated-Uncoordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 4: Route 146 & Boston Road
